Physical Review Letters

PRL Today

Abstract

How do the editors of Physical Review Letters determine which of the approximately 10,000 papers that it receives each year should be published? Science journals are being transformed by the internet: now their role appears to be to validate research, not to disseminate it. How is PRL in particular adapting to this changing environment? What guidelines would be helpful to you as an author and a referee? Why should you submit your work to PRL? I plan to address -- with plenty of interspersed Q & A -- these and related issues.
